Ashoke Sen
Nishu Chandra Bose Memorial
2012 Breakthrough Prize in Fundamental Physics

For pioneering striking evidence of string theory duality in certain supersymmetric gauge theories and groups theories, opening the path to the resolution of all string theories and different forms of the same underlying theory.

The Science
String theory conjectures that what appear to us as fundamental particles are in fact actually the various vibrational modes of something that is called "string". But there is not only one string theory – there are many different kinds of them. String theory makes predictions in physics that are hard to test experimentally. The "duality" aspect of theory that described interactions involving string theory in theory of interactions generally used there. This was particularly important because it implied that different string theories were in fact one theory to be approached under the other theory, which they might be much more tractable. And so to answer a long-standing question – equivalence between different string theories – that small object is a revolution in the field.
