SEALING FILM/MAT ROLLER

The Adhesive Seal Roller and Adhesive Seal Applicator ensure even pressure is applied across the seal for a complete application to the plate

- To obtain the best sealing results when using our Adhesive Seals, we strongly recommend the use of the Adhesive Seal Roller or Adhesive Seal Applicator.
- Both application tools ensure even pressure is applied across the adhesive seal for complete and secure application to your plate, across every well.
- The handle of the Adhesive Seal Roller is made of a durable plastic, with a semi-hard padded rolling wheel.
- The straight rigid sides of the small-sized Adhesive Seal Applicator allow for even pressure application.

CELL CULTURE FLASK (MULTI LAYER) & BIO-FACTORY

5-layer cell culture flask

- High clarity medical grade polystyrene material
 - Growth area: 870cm²
 - TC treatment for better cell attachment
 - Sterilized by E-Beam, non-pyrogenic
 - Both plug seal cap and vent cap are available
- Tips: To avoid foams and bubbles causing the media in upper layer flowing into the bottom layer, a gentle operation requested while operating the multi-layer flasks.

BioFactory™

Layer: 1 Layer / 2 Layers / 5 Layers / 10 Layers / 40 Layers

- USP Class VI grade polystyrene material
 - Nest BioFactory™ Systems are compact, multi-layer, single-use cell culture systems designed for easy scale-up cell culture applications, such as production of vaccines, monoclonal antibodies or pharmaceuticals. Versatile, easy-to-use systems for small scale research or commercial production with reduced contamination risk. Narrow mouth caps available for tubing solutions.
 - Temperature Range: Approx.-86 to+64°C
 - Sterilized by E-Beam SAL=10⁻⁶
 - Non-pyrogenic
 - Double-layer sterile bag
 - TC treated , good for cell attachment and growth
 - Clear lot number for batch traceability
- Ultrasonic welding without extrinsic ingredients. Excellent welding line design can avoid producing particles during welding. And make the biofactory stronger.
 - Vent caps with 0.22um hydrophobic filters for gas exchange without contamination.
 - Wide mouth is applicable to pour culture medium directly. Narrow mouth is applicable to operate with the aseptic pipeline.
 - Growth kinetics are the same as cells grow in the cell culture flasks. Applicable to large-scale culture adherent cells.
 - Large growing area. Just a single operate, you can cultivate a large number of cells and reduce contamination risk.
 - Applicable to automatic machine. Standardize operations to reduce batch differences.

Recommendations:

A gentle operation requested while using the biofactory to avoid air bubbles. Air bubbles will lead the culture medium flow from the upper layer to the lower layer.

SCISEAL PIERCEABLE SEALING FILM (FOR GENERAL APPLICATION)

- Easily Pierceable, Inert and Chemical resistant
- Protect samples short-term and limit evaporation
- Excellent Films for Sample Recovery
- EZ-Pierce and Zone free films are 70 μ m thick , X Pierce film is 100 μ m.
- Functional temperature ranges -40 $^{\circ}$ C to +90 $^{\circ}$ C
EZ-Pierce films are easily pierceable by robotic probes and pipette tips for sample recovery. Zone-

Free™ films feature adhesive-free top layer with a inert white polypropylene/adhesive sublayer. The easy-piercing top layer allows direct sample recovery with pipette tips without adhesive fouling and minimizes adhesive contact with samples. X-Pierce™ films are designed for temporary protection of samples in multiwell plates. Precut "X" over each well creates four flaps that easily bend downward when pushed by pipette tip allowing sample access without adhesive fouling. The flaps return to their original position after sampling for continued protection.

PLANT GROWTH REGULATOR

Plant Preservative Mixture (PPM), is a broad-spectrum biocide/fungicide for plant tissue culture. PPM™ is the ultimate solution to the never-ending struggle against microbial airborne, waterborne and endogenous contamination.

Plant Preservation Mixture (PPM™) is a robust broad-spectrum biocide formulated for use in plant tissue culture. PPM™ targets bacteria and fungi in plant tissue culture growth media as well as contaminated tissue. It affects key enzymes in the Krebs cycle and in the Electron Transport Chain. Depending on the dose and the level of contamination, PPM is a biocidal component in plant culture medium. In addition, it may also function as a biostatic compound as a preventative measure. When diluted with plant growth media it is effective as a microbiocide (i.e. bactericide and

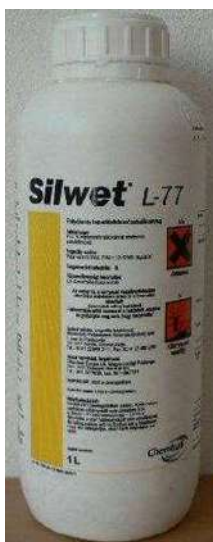

fungicide) against non-human health pathogenic organisms component of liquid or semi-solid plant culture media.

PPM™ is effective for most seed bearing plants - angiosperm, as well as gymnosperm- however, it is not recommended for use in ferns, mosses, algae and aquatic plants. Optimization may be required to maximize potency. While PPM is an excellent tool in the prevention and elimination of culture contamination it is not a substitute for aseptic laboratory techniques and appropriate air handling systems are recommended.

Blotting that works!

Southern, Northern and Western Blotting are common techniques used for the transfer of nucleic acid and protein fragments from polyacrylamide or agarose gels to blotting membranes such as nitrocellulose, nylon or PVDF membranes.

STARLAB's Semi-Dry Electro-Blotters have a large surface area of plate electrodes to enable rapid and highly efficient transfer in conjunction with high signal strength. The highly conductive platinised titanium and stainless steel plate electrodes allow transfer at low voltages without the use of external cooling systems.

STARLAB Electro-Blotters consume significantly less transfer buffer without a loss in transfer efficiency or signal strength. A safety cover prevents the reverse orientation of electric fields, and the robust acrylic construction guarantees easy handling without breakage, warping or leakage.

High Voltage!

Results of electrophoresis and electroblotting techniques depend not only on the primary equipment but also on reliable power supplies.

Adjusted to specific requirements of different separating and transferring applications, STARLAB power supplies are available in ranges from 300 V/400 mA up to 1000 V/600 mA. They are designed according to international and CE European guidelines to guarantee the highest quality and safety.

The last setting is automatically restored at power up and the timer function (except Type 300-400) also allows user friendly analysis runs. A further feature is a tactile membrane panel for precise input of parameters.

STARLAB power supplies have LED displays to indicate voltage and current (a display indicates time on some models), and they also have automatic restart in the case of power failure, making them the first choice for your laboratory.

AGAROSE FOR ELECTROPHORESIS

StarPure Agarose

Product Overview

Agarose is a neutral polysaccharide extracted from the cell walls of certain Rhodophyceae algae also known as agarophyte seaweeds.

The molecular structure of this polysaccharide gives the capacity to form gels that are very strong even at low concentrations.

StarPure Agaroses are reliably high quality products for Gel Electrophoresis in Biotech laboratories.

They can be used with, but are not limited to, StarPhoresis Electrophoresis Systems. Six StarPure grades will cover the most common applications in biotech labs.

StarPure Agarose
CAS: 9012-36-6 EC: 2327318
For laboratory use only.
Store at room temperature.

PARAFIN COATED PAPER (WAX PAPER)

These wax paper sheets are so great...I use my envelope template to make vintage mini envelopes, I wrap small gifts with them but I mostly use them for tissue paper. Since so many of my packages I sell are small, they are the perfect size instead of the regular large tissue paper sheets. Be Green :)

OPTICA CELLS FOR SPECTROPHOTOMETER GLASS

Polarimetric Measurement for some applications, e.g. in polarimetri and for circular dichroism measurements, it is important to check that the cells are free of strain birefringence. The effect of possible strain birefringence is determined in the following way: In a polarimeter the rotation of the plane of polarisation of the incident linearly polarised light is measured. The measurement is carried out in a circular area of approximately 3 mm diameter whose centre coincides with the centre height of the empty cell. Because of the measuring geometry, only cells with an aperture diameter or aperture width of greater than 3 mm can be measured in this way

OPTICA CELLS FOR SPECTROPHOTOMETER QUARTZ

Our Cuvettes are high-quality cells designed to hold liquid samples. The UV fused quartz glass construction allows these cuvettes to be used with UV light at wavelengths as low as 200 nm, as well as with visible and infrared light up to 3 μ m. We offer cuvettes with either two polished sides, for use in absorption spectroscopy experiments, or four polished sides, for use in fluorescence spectroscopy. The polished sides can be cleaned using standard optics cleaning procedures. Versions are also available with one of two PTFE tops: a cap to block dust and other particles or a stopper to prevent evaporation and provide an airtight seal

TEST SIEVES

The majority of sieving methods and practices specify test sieves meeting ASTM E11 or ISO 565/3310-1 specifications. These two specifications have become more closely harmonized in recent years to simplify international use. Refer to the **sieve sizes** reference chart.

AASHTO M92 is a specification often used by state or federal transportation agencies and closely follows ASTM E11. Test Sieves meeting these specifications are supplied in Compliance Grade; serial numbered and supplied with a certificate of manufacturing conformance.

For applications where documented accuracy is required, Compliance Grade sieves can be upgraded to Inspection or Calibration Grades by adding the appropriate Gilson Verification Service to your order.

- **ASTM Test Sieves** are available in all mesh sizes, with frames and mesh constructed of stainless steel, brass or combination brass frame and stainless steel cloth. These sieves meet ASTM E11 and AASHTO M92 requirements. Selection of frame diameter and full or half-height configuration is based on specimen volume and particle size.
- **ASTM Supplemental Sieves** comply with ASTM E11 which incorporates a new range of opening sizes for test sieves (supplemental sizes), intended to supplement existing sizes. Gilson offers these Metric Alternative sizes in stainless steel cloth installed in conventional 3in, 8in, and 12in diameter stainless steel frames.
- **ISO Test Sieves** are based on SI, or metric dimensions, with 200mm or 300mm diameter and all ISO mesh sizes available. These sieves meet ISO 565 and 3310-1 specifications. They are constructed of stainless steel frame and mesh or brass frame with stainless steel mesh, and come in full- or half-height sizes.
- **Wet-Wash Sieves** feature durable extra-deep brass or stainless steel frames to contain wash water, avoid sample loss and allow accurate and efficient preparation and testing of materials. Some models are designed with interchangeable screens and discs that are easily replaceable for extended service life. The Elutriation Sieve is a unique design, well suited for washing samples with high fines contents.
- **3" Acrylic Frame Test Sieves** are designed for the **GA-6 Gilsonic Autosiever** and other Sonic Sifters. Acrylic Frame Test Sieves are precision-made and allow enhanced visibility during testing. Available fitted with ASTM E11 woven wire cloth or ASTM E161 Precision Electroformed Mesh, these sieves can also be substituted for 3in metal frame sieves when using the **3in Vibratory Sieve Shaker**. E11 Acrylic Frame Test Sieves are designed to reduce sample loss, while the ASTM E11 Precision Electroformed Mesh Sieves offer precise particle sizing of fine powders.
- **Air Jet Sieves** are special test sieves required for use with old-style Micron Air Jet Sieves. They have stainless steel frames with stainless steel mesh, and can be upgraded from Compliance Grade to Inspection or Calibration Grade when ordering by specifying Gilson Verification Services. They can also be easily modified for use with the new Mikro Air Jet Sieve™.
- **ASTM Precision Electroformed Sieves** are available in a wide range of opening sizes. Accuracy to $\pm 2\mu\text{m}$ makes the ASTM Precision Electroformed Sieve the ideal choice for very fine powders. The mesh is formed by electrodeposition of nickel onto a precisely-sized grid form. Electroformed sieves have 8in or 3in frames with extremely accurate mesh openings in sizes as small as $5\mu\text{m}$. They comply with ASTM E161 and ISO 565/3310-3 requirements. Come with a Certificate of Compliance.
- **Two-Part Replaceable Mesh Sieves** are available in clear non-metallic polycarbonate or brass. The 8in diameter sieve frames use replaceable non-metallic cloth that is easily removed and discarded after use. The sieve cloth is made of monofilament polyester or nylon and is ideal for materials that are sensitive or hazardous, or when cross-contamination is a concern.
- **3" Non-Metallic Sieves** are non-metallic test sieves hand-made by Gilson, and useful for wet sieving of small samples. Each sieve features a clear polycarbonate frame and polyester mesh. The clear frame offers easy viewing of wet sieving operations. The sieves seal when nested, are autoclaveable, and microwaveable for drying.

Sieve mesh sizes are based on dimensions of the mesh size opening, or on the number of openings per linear inch. The two major standards governing test sieves and appropriate sizes are ASTM E11 and ISO 565/3310-1, both of which specify parameters for aperture dimensions, mesh size, and statistical variations.

Opening sizes and mesh diameters for test sieves are often duplicated between these two standards, making it easier to select the proper sieve size for your material. The above table is a list of all available sieves in U.S. and metric sizes for both ASTM E11 and ISO 565/3310-1. Sieve mesh opening sizes range from 5in (125mm) down to #635 (20µm). The table outlines the standard, an alternate and the recommended sizes.

Gilson test sieves for particle size analysis of fine or coarse materials, soil, powder and other applications are available with brass or stainless steel frames fitted with brass or stainless steel cloth meeting ASTM or ISO standards. Common frame diameters, 3in (76mm), 8in (203mm), and 12in (305mm), as well as many ISO sizes in 200 mm and 300 mm frames, are in stock ready to ship. Other frame sizes such as 6in (152mm), 10in (254mm), and 18in (457mm) can be ordered. ASTM wire cloth is available cut-to-order or in bulk.

SMARTCOAT DECONTAMINANTS

- Decomposing anything organic in nature (like micro-organisms) which comes into contact with, or onto a treated area. Bacteria, viruses, fungi and many other airborne contaminants being typical examples:
- SmartCoat's technology utilizes any light source to activate its oxidative ability when it is applied onto surfaces.
- Through this process, SmartCoat's surfaces are able to break any organic matters upon contact.

BIOLOGICAL INDICATORS

STERIS Spordex® Biological Indicator Strips are specifically designed for determining the effectiveness of steam, ethylene oxide (EO) and dry heat sterilization procedures. Each strip is inoculated with bacterial spores, either *Bacillus atrophaeus* (BA) (formerly *Bacillus subtilis* var. niger) for ethylene oxide and dry heat sterilization or *Geobacillus stearothermophilus* (GS) for saturated steam sterilization. Each easy to peel glassine pouch has the lot number, organism and expiration printed on it. Spordex Biological Indicator Strips are available in a variety of standard populations as well as custom configurations.

HOW SPORDEX STRIPS WORK

Spordex Biological Indicator Strips are small strips of special filter paper inoculated with bacterial spores, either *Bacillus atrophaeus* (BA) for ethylene oxide and dry heat sterilization or *Geobacillus stearothermophilus* (GS) for saturated steam sterilization. Each strip is packaged in a glassine envelope and is used to validate or requalify sterilization processes.

WHY SPORDEX STRIPS?

- **Ease of Use** - Individually packaged strips in sterilizable envelopes for easy placement in your test pack.
- **Reliability** - Lot number and expiration printed on each glassine envelope.
- **Easy to Validate** - Each lot is documented with population and resistance for either *B. atrophaeus* and *G. stearothermophilus* spores.
- **Efficacy** - Meet the suggested performance parameters published in the current USP standards.
- **Flexibility** - Custom designed strips with defined populations or D-value ranges are available.

CHEMICAL INDICATORS

STERIS Steraffirm™ Bowie Dick Test Packs are pre-assembled single-use test packs designed to evaluate the performance of the air removal system of a pre-vacuum equipped sterilizer. Several versions of these test packs are available. They are calibrated to be compatible with pre-vacuum cycles operating at specific exposure temperatures or within a specified exposure temperature range (e.g., 121° C/250° F). They conform to the ISO 11140 (Type 2) standards. They are for use in Life Sciences applications only. They are not cleared for use in healthcare facilities in the United States.

HOW STERAFFIRM BOWIE DICK TEST

PACKS WORK

STERIS Steraffirm Bowie Dick Test Packs should be placed over the drain each day to test your pre-vacuum steam sterilizer. During the cycle, the indicator ink will change from yellow to a blue/purple color. After the cycle is complete, the indicator card can be removed and kept for your records. Steraffirm Bowie Dick Test packs can help identify a problem before you have sterilization failures while helping to identify the potential source of the problem.

WHY STERAFFIRM BOWIE DICK TEST PACKS?

- **Reliability** - Preassembled single use test provides consistent testing of the pre-vacuum steam sterilizer cycles.
- **Productivity** - Distinctive, total color change from yellow to a blue/purple color provides a clear indication of a successful test.
- **Easy to Validate** - Each pack and indicator has a lot number and expiration date printed on it for easy documentation.
- **Efficacy** - Conforms to ISO 11140 Type 2 standards.
- **Flexibility** - Indicator can detect wet steam, superheated steam, and noncondensables in the steam supply to aid troubleshooting problems.

Rhizon samplers, for extracting pore water

Rhizons for sampling pore water

Rhizon samplers extract small volumes of pore water from soil and sediments, in an easy, non-destructive way. They can be used for sampling water from unsaturated soils as well as from saturated zones.

For the measurement of all dissolved compounds in soil moisture or water, Rhizon samplers can be used. The mean pore size of the porous part is 0.15 µm, hence filtering the samples before analyzing is unnecessary.

New: Also Rhizons with a mean pore size of 0.6 µm are available. Have a look on [Rhizons](#) or [contact us](#).

Rhizon samplers are made of inert polymer with no ion exchange properties. Other advantages of Rhizons are their small diameter and low dead volume. Rhizons are easy to handle and once installed for an experiment, they can be used frequently.

DNASTable® Blood

Stabilize and Preserve DNA in Whole Blood at Room Temperature

- Preserve DNA in blood and buffy coat samples for at least 12 years at ambient temperatures.
- Cost effective and convenient blood sample archiving
- Available in either liquid or pre-dried formats
- Compatible with all downstream applications
- Cost Effective Solutions to Store Blood Samples

DNASTable® Blood and DNASTable® Blood LD are innovative products for dry storage and preservation of DNA in blood samples at ambient temperatures. The DNASTable Blood matrix forms a thermostable barrier as samples dry, protecting the blood DNA from degradation. DNASTable Blood is available in two convenient formats: pre-dried in tubes and multi-well plates (DNASTable Blood) and liquid (DNASTable Blood LD). Once the DNASTable Blood reagent is mixed with blood, samples can be dried in a laminar flow hood at room temperature, in a ventilated 40°C incubator, or in a vacuum centrifuge. Samples can then be stored at ambient temperature for at least 12 years (based on accelerated aging studies).

- Preserves RNA at ambient temperatures without degradation
- Eliminates the need to store RNA in freezers or to ship on dry ice
- Concentrates RNA more effectively than other methods
- Compatible with most downstream applications

RNASTable® and RNASTable® LD allows you to preserve and ship your total RNA, mRNA, and miRNA for up to 12 years at ambient temperatures*. They provide a cost-effective, eco-friendly solution to freezer crawl and lab space

management. Moreover, they eliminate sample loss due to freeze/thaw cycles. When you are ready to use your RNA samples, you can fully recover them in minutes without any additional purification steps.

RNAstable is available in two convenient formats:

RNAstable: provided pre-dried in 1.5 ml microfuge tubes and 96-well plates to which hydrated RNA can be added.
RNAstable LD: a liquid reagent which can be added directly to RNA samples in your own tubes, multi-well plates, or other containers.

i-Taq™ DNA Polymerase

High-purity i-Taq™ PCR core kit that displays stable and efficient DNA amplification regardless of template type and reaction conditions

- 94 KDa thermostable DNA polymerase
- High purity Taq DNA Polymerase
- Removal of E. coli -derived proteins and DNA that may act as PCR sources
- Applicable to DNA from cloned DNA to human genomic DNA
- Buffer optimization to show the best

polymerase activity regardless of template type or reaction conditions

i-Taq™ DNA Polymerase is a thermostable DNA polymerase of 94 kDa, which is expressed in E. coli by cloning the polymerase gene of *Thermus aquaticus* (strain YT1). It removes the E. coli-derived protein and DNA which can act as a contaminant in PCR. It is stable and efficient DNA amplification product. Genomic DNA, cDNA, etc. can be amplified up to 5 Kb. PCR (Polymerase Chain Reaction) is a method of amplifying a desired DNA molecule in a test tube by specifically repeating synthesis of a specific DNA site. As a result, it is possible to synthesize a large amount of DNA using a very small amount of DNA. Of course, it is widely used in the fields of basic biology, medicine, and biology. We are now expanding the scope of its use in the fields of forensic medicine, food, environmental hygiene, and animal and plant inspection in a simple and quick way. DNA polymerase chain reaction can amplify DNA of specific site in a few hours up to 10^5 - 10^8 times in vitro. The amplified DNA can be used for various experiments as follows. Based on the experimental results, various medical researches can be applied to. In the early days when this method was developed, PCR was performed using *Escherichia coli* DNA Polymers, so it was necessary to supplement DNA polymerase of denatured *Escherichia coli* at every denaturation. However, by using the thermostable DNA Polymerase isolated from *Thermus aquaticus* in PCR, we did not have to do the

troublesome task of supplementing the enzyme every step. As a result, PCR became an indispensable method for molecular biology. PCR has a series of three steps and repeats 30 to 40 times.

The first step in the PCR is denaturation of the DNA, separating the two strands of DNA by heating. Each separated DNA serves as a template and the denaturation temperature depends on the amount and length of G + C in the DNA. The second step in PCR is annealing. At this stage, the primers bind to the template DNA and the annealing temperature is an important factor in determining the accuracy of the reaction. If the temperature is too high, the primers will bind too weakly to the template DNA, If the temperature is too low, undesirable DNA can be amplified because the primers bind nonspecifically. The third step in PCR is the elongation step. At this stage, heat-resistant DNA polymerase will make new DNA from the template DNA. i-Taq™ DNA Polymerase In addition to high purity enzymes, it is possible to obtain highly reproducible results by optimizing the buffer composition to exhibit the best polymerase activity irrespective of the type of template or half of the template. Since most of the products amplified with this enzyme have a base A at the 3-terminus, the PCR product can be cloned into a T-vector as it is. It can also be cloned into a blunt-end vector by phosphorylating it into a blunt end by filling it with a DNA polymerase such as Klenow DNA Polymerase or T4 DNA Polymerase.

Applications

- **01** Genomic DNA, cDNA are amplified to 5kb
- **02** T/A Cloning or Blunt-end Cloning

Patho Gene-spin™ DNA/RNA Extraction Kit

A product which extracts DNA/RNA easily and quickly from various pathogenic samples infected by virus or bacteria such as plasma, blood, serum, cell-free body fluids, cell, and tissue etc.

- Used low concentration of chaotropic salt and better lysis efficiency
- Higher efficiency of lysis without additional additives
- Stable extraction of DNA/RNA from various pathogenic samples
- Be used safely with non-phenol method and no need for EtOH precipitation
- Suitable for sample extraction such as forensic medicine and diagnosis of diseases etc.

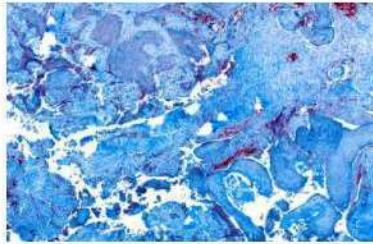

The Patho Gene-spin™ DNA/RNA Extraction Kit uses a low concentration of chaotropic salt and has a better lysis efficiency unlike conventional Total RNA Extraction products. Total DNA/RNA can be extracted from various pathogen samples like virus and bacteria, even anticoagulated plasma/blood, serum, cell-free body fluids and pathogenic cell/tissue etc. And it is easy to induce lysis without any additive like mercaptoethanol. In addition, DNA/RNA extraction is faster and more efficient by using columns that silica-gel membrane technology applied. The DNA/RNA isolated by the Patho Gene-spin™ Kit can be used for clinical diagnosis of people and animals infected with diseases caused by viruses and bacteria.
