Integrated M.Sc.-Ph.D. Program

School of Mathematical Sciences

National Institute of Science Education and Research Bhubaneswar

Outline of the Academic Program

- The Integrated M.Sc.-Ph.D. programme at NISER shall consist of the following two components:
 - (I) *Course Work* involving classroom courses and projects as well as a Master's thesis leading to the award of M.Sc. degree in Mathematics,
 - (II) *Research Work* leading to a Ph.D. thesis and the award of Ph.D. degree in Mathematics.
- The duration of the course work shall be equivalent to the first three academic years. The evaluation of the students will be based on continuous assessments (quizzes, home works etc.) and examinations. The Master's thesis will be evaluated in each semester of third year by the School and it will have to be defended in an open thesis defence.
- Students must secure a CGPA of at least 5.0 in each semester. The students who have a CGPA of at least 5.5 at the end of third year and successfully defend their Master's dissertation shall be eligible for awarding of the Master's degree.
- Students who are unsuccessful in earning a CGPA of 5.5 after the first two years shall be considered ineligible for the awarding of M. Sc. degree.
- For the continuation of studies towards a Ph.D. degree, a student must secure a CGPA of 6.0 at the end of second year. Also the student will be required to take a Comprehensive Examination based on the courses attended during the course work. The students should pass this examination within six months of successful defence of their Master's thesis. They will get a maximum of two attempts to clear the Comprehensive Examination. A student failing to pass the Comprehensive Examination twice will be terminated from the programme.
- On clearing the comprehensive examination and the successful completion of the course work, the PGCS after informing the PGCI can recommend the student to register for a Ph.D.

Course structure

Semester	Course No.	L-P-T	Credits		Course Name
	MA701	3-0-1	8	-	Linear Algebra
	MA702	3-0-1	8	-	Mathematical Analysis
Semester I	MA703	3-0-1	8	-	Number Theory
	MA704	3-0-1	8	-	Differential Equations
	MA705	3-0-1	8	-	Calculus of Several Variables
	MA706	3-0-1	8	-	Groups and Rings
	MA707	3-0-1	8	-	Measure and Integration
Semester II	MA708	3-0-1	8	-	Probability Theory
	MA709	3-0-1	8	-	Complex Analysis
	MA710	3-0-1	8	-	Graph Theory
	MA801	3-0-1	8	-	Functional Analysis
	MA802	3-0-1	8	-	Module Theory
Semester III	MA803	3-0-1	8	-	Topology
	****	3-0-1	8	-	Elective-I
	MA848	-	8	-	Project-I
	MA804	3-0-1	8	-	Geometry of Curves and Surfaces
Semester IV	MA805	3-0-1	8	-	Partial Differential Equations
	MA806	3-0-1	8	-	Field Theory
	****	3-0-1	8	-	Elective-II
	MA849	-	8	-	Project-II
	****	3-0-1	8	-	Elective-III
Semester V	****	3-0-1	8	-	Elective-IV
	MA948	-	24	-	Dissertation
	****	-	0	-	Research Methodology(Ph.D.)
	MA901	3-0-1	8	-	Algebraic Topology
Semester VI	****	3-0-1	8	-	Elective-V
	MA949	-	24	-	Dissertation
	****	-	2	-	Research and Publication Ethics(Ph.D.)

Core Courses

Course No.		Credits		Course Name
MA701	-	8	-	Linear Algebra
MA702	-	8	-	Mathematical Analysis
MA703	-	8	-	Number Theory
MA704	-	8	-	Differential Equations
MA705	-	8	-	Calculus of Several Variables
MA706	-	8	-	Groups and Rings
MA707	-	8	-	Measure and Integration
MA708	-	8	-	Probability Theory
MA709	-	8	-	Complex Analysis
MA710	-	8	-	Graph Theory
MA801	_	8	_	Functional Analysis
MA802	-	8	_	Module Theory
MA803	-	8	-	Topology
MA804	-	8	-	Geometry of Curves and Surfaces
MA805	-	8	-	Partial Differential Equations
MA806	-	8	-	Field Theory
MA901	-	8	-	Algebraic Topology

Elective Courses

Course No.		Credits		Course Name
MA851	-	8	-	Representations of Finite Groups
MA852	-	8	-	Advanced Complex Analysis
MA853	-	8	-	Advanced Functional Analysis
MA854	-	8	-	Introduction to Stochastic Processes
MA855	-	8	-	Algebraic Geometry
MA856	-	8	-	Algebraic Graph Theory
MA857	-	8	-	Algebraic Number Theory
MA858	-	8	-	Algorithm
MA859	-	8	-	Cryptology
MA860	-	8	-	Finite Fields
MA861	-	8	-	Information and Coding Theory
MA862	-	8	-	Mathematical Logic
MA863	-	8	-	Nonlinear Analysis
MA864	-	8	-	Operator Theory
MA865	-	8	-	Theory of Computation
MA866	-	8	-	Abstract Harmonic Analysis
MA867	-	8	-	Advanced Number Theory
MA868	-	8	-	Advanced Probability
MA869	-	8	-	Algebraic Combinatorics
MA870	-	8	-	Foundations of Cryptography
MA871	-	8	-	Incidence Geometry
MA872	-	8	-	Lie Algebras
MA873	-	8	-	Advanced Partial Differential Equations
MA874	-	8	-	Random Graphs
MA875	-	8	-	Randomized Algorithms and Probabilistic Methods
MA876	-	8	-	Introduction to Manifolds
MA877	-	8	-	Commutative Algebra
MA878	-	8	-	Algebraic Computation
MA879	-	8	-	Analytic Number Theory
MA880	-	8	-	Classical Groups
MA881	-	8	-	Ergodic Theory
MA882	-	8	-	Harmonic Analysis
MA883	-	8	-	Lie Groups and Lie Algebras-I
MA884	-	8	-	Operator Algebras
MA885	-	8	-	Representations of Linear Lie Groups
MA886	-	8	-	Harmonic Analysis on Compact Groups
MA887	-	8	-	Modular Forms of One Variable

	Credits		Course Name
-	8	-	Elliptic Curves
-	8	-	Brownian Motion and Stochastic Calculus
-	8	-	Differentiable Manifolds and Lie Groups
-	8	-	Lie Groups and Lie Algebras-II
-	8	-	Mathematical Foundations for Finance
-	8	-	Designs and Codes
-	8	-	Ordered Linear Spaces
-	8	-	Topics in H^p Spaces
-	8	-	Introduction to Dilation Theory
		Credits - 8 - 8 - 8 - 8 - 8 - 8 - 8 - 8 - 8 - 8	Credits 8 -

Course Title	: Linear Algebra
Course Code	: MA701
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

Learning different fundamental results of linear transformations and matrices, e.g. eigenvalues and eigenvectors, diagonalization, triangulation, rational and Jordan canonical forms.

Course Contents:

System of linear equations, matrices, Gauss elimination, Basis, dimension of a vector space, Linear Transformations and its representations by Matrices, rank-nullity theorem, Transpose of a Linear Transformation, Determinants, Characteristic Values, Annihilating Polynomials, Diagonalization and Triangulation, Primary Decomposition Theorem, Rational and Jordan canonical forms, Inner product spaces, Gram-Schmidt orthonormalization, linear functionals and adjoint, Hermitian, self-adjoint, unitary and normal operators, spectral theorem for normal operators, Bilinear forms, symmetric and skew-symmetric bilinear forms, groups preserving bilinear forms.

Text Books:

1. Hoffman, K.; Kunze, R.; Linear Algebra, Prentice Hall.

- 1. Artin, M.; Algebra, Prentice Hall, 1991.
- 2. Lax, P., Linear ALgebra and its applications, John Wiley & Sons, Second edition, 2007.
- 3. Rose, H.E.; Linear Algebra, Birkhauser, 2002.

Course Title	: Mathematical Analysis
Course Code	: MA702
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

Upon successful completion of the course, students will have a thorough understanding of the basic concepts of metric spaces. They will also be familiar with the concepts of sequences and series of functions and approximation theorems.

Course Contents:

Metric spaces, open balls and open sets, limit and cluster points, closed sets, dense sets, complete metric spaces, completion of a metric space, Continuity, uniform continuity, Banach contraction principle, Compactness, Connectedness.

Sequences of functions, Pointwise convergence and uniform convergence, Arzela-Ascoli Theorem, Weierstrass Approximation Theorem, power series, radius of convergence, uniform convergence and Riemann integration, uniform convergence and differentiation.

Functions of bounded variation. Riemann-Stieltjes Integrals.

Textbooks:

- 1. N. L. Carothers, Real Analysis, Cambridge University Press, 2012.
- 2. W. Rudin, Principles of mathematical analysis, McGraw-Hill Book Co., 1976.

- 1. S. Kumaresan, Topology of Metric Spaces, Narosa Publishing House, 2005.
- 2. G. F. Simmons, Introduction to Topology and Modern Analysis, Tata McGraw-Hill, 2013.
- 3. Tom M. Apostol, Mathematical analysis, Addison-Wesley, 1974.
- 4. R. P. Boas, A Primer of Real Functions, MAA/AMS, Carus Monographs, Volume 13, Fourth Edition, 1960.

Course Title	: Number Theory
Course Code	: MA703
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

Learning the elementary properties of rings of integers including divisibility, congruences, continued fractions and Gauss reciprocity laws.

Course Contents:

Divisibility, Primes, Fundamental theorem of arithmetic, Congruences, Chinese remainder theorem, Linear congruences, Congruences with prime-power modulus, Fermat's little theorem, Wilson's theorem, Euler function and its applications, Group of units, primitive roots, Quadratic residues, Jacobi symbol, Binary quadratic form, Arithmetic functions, Möbius Inversion formula, Dirichlet product, Sum of squares, Continued fractions and rational approximations, Riemann zeta function.

Text Book:

1. I. Niven, H. S. Zuckerman, H. L. Montgomery, "An Introduction to the Theory of Numbers", Wiley-India Edition, 2008.

- 1. T. M. Apostol, "Introduction to Analytic Number Theory", Springer International Student Edition, 2000.
- G. A. Jones, J. M. Jones, "Elementary Number Theory", Springer Undergraduate Mathematics Series. Springer-Verlag, 1998.

Course Title	: Differential Equations
Course Code	: MA704
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

- Learning different techniques to obtain explicit solutions of 1st order and second order ODE and its applications.
- learning general theory existence, uniqueness and continuous dependence of general ODE.
- Understanding propeties of solutions as maximum principle, asymptotic behaviour and phase portrait analysis of 2nd order equations.
- Leraning characteristics method for solving 1st order partial Differential Equations.

Course Contents:

Classifications of Differential Equations: origin and applications, family of curves, isoclines. First order equations: separation of variable, exact equation, integrating factor, Bernoulli equation, separable equation, homogeneous equations, orthogonal trajectories, Picard's existence and uniqueness theorems. Second order equations: variation of parameter, annihilator methods. Series solution: power series solutions about regular and singular points. Method of Frobenius, Bessel's equation and Legendre equations. Wronskian determinant, Phase portrait analysis for 2nd order system, comparison and maximum principles for 2nd order equations. Linear system: general properties, fundamental matrix solution, constant coefficient system, asymptotic behavior, exact and adjoint equation, oscillatory equations, Green's function. Sturm-Liouville theory. Partial Differential Equations: Classifications of PDE, method of separation of variables, characteristic method.

Text Books:

- 1. S. L. Ross, "Differential Equations", Wiley-India Edition, 2009.
- 2. E. A. Coddington, "An Introduction to Ordinary Differential Equations", Prentice-Hall of India, 2012.

- 4. C. M. Bender, S. A. Orszag, "Advanced mathematical methods for Scientists and Engineers", Springer Verlag, 1999.

Course Title	: Calculus of Several Variables
Course Code	: MA705
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

Learning the notion of limits, continuity, differentiation and integration in the higher dimensional euclidean spaces.

Course Contents:

Differentiability of functions from an open subset of \mathbb{R}^n to \mathbb{R}^m and properties, chain rule, partial and directional derivatives, Continuously differentiable functions, Inverse function theorem, Implicit function theorem, Interchange of order of differentiation, Taylor's series, Extrema of a function, Extremum problems with constraints, Lagrange multiplier method with applications, Integration of functions of several variables, Change of variable formula (without proof) with examples of applications of the formula, spherical coordinates, Stokes theorem (without proof), Deriving Green's theorem, Gauss theorem and Classical Stokes theorem.

Text Books:

- 1. W. Fleming, "Functions of Several Variables", Undergraduate Texts in Mathematics. Springer-Verlag, 1977.
- 2. T. M. Apostol, "Calculus Vol. II", Wiley-India edition, 2009.

References:

Course Title	: Groups & Rings
Course Code	: MA706
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

Understanding the properties of group actions and their various applications. Understanding the various ring structures, especially polynomial rings over fields.

Course Contents:

Group Theory: Dihedral and Permutation groups, normal subgroups, group homomorphisms (Review only). Group isomorphism theorems, Group actions, Sylow's theorem, Simplicity of the alternating groups, Direct and semi-direct products, Structure of finitely generated abelian group (statement only).

Ring Theory: Properties of Ideals, Isomorphism theorems, Chinese remainder theorem, Field of fractions, Euclidean Domains, Principal Ideal Domains, Unique Factorization Domains, Polynomial rings, Gauss lemma, Irreducibility criteria.

Textbooks:

1. Dummit, D. S.; Foote, R. M.; *Abstract Algebra*, Third Edition, John Wiley & Sons.

- 1. Hungerford, T. W.; Algebra, Graduate Texts in Mathematics, 73, Springer.
- 2. Burton, David; A First Course in Rings and Ideals. Addison-Wesley.
- 3. Artin, M.; Algebra, Prentice Hall, 1991.

Course Title	: Measure & Integration
Course Code	: MA707
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

Upon successful completion of the course, students will be familiar with various advanced concepts and techniques from measure theory.

Course Contents:

Abstract measure. Construction of Lebesgue measure. Measurable functions. Integration. Comparison of Riemann and Lebesgue integration. Convergence in measure. Monotone convergence theorem. Dominated convergence theorem. Fatou's lemma. Product measures (including infinite product). Fubini's theorem. Convolutions. Change of variables. Integration in polar co-ordinates.

Signed measures and Radon-Nikodym theorem. L_p spaces. Dual of L_p spaces. Complex measures. Riesz representation theorem.

Textbooks:

- 1. G. B. Folland, Real Analysis, Wiley-Interscience Publication, John Wiley & Sons, 1999.
- 2. S. Kesavan, Measure and Integration, Texts and Readings in Mathematics 77, Hindustan Book Agency, 2019.

- 1. W. Rudin, Real and Complex Analysis, McGraw-Hill, 1986.
- 2. H. L. Royden, Real Analysis, Prentice-Hall of India, 2012.
- 3. R. B. Ash; C. A. Doléans-Dade, Probability and Measure Theory, Academic Press, 2nd Edition.

Course Title	: Probability Theory
Course Code	: MA708
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

Understanding the basic theory of probability starting from axiomatic definition of probability up to limit theorems of probability.

Course Contents:

Combinatorial probability and urn models; Conditional probability and independence; Random variables – discrete and continuous; Expectations, variance and moments of random variables; Transformations of univariate random variables; Jointly distributed random variables; Conditional expectation; Generating functions; Limit theorems; Simple symmetric random walk.

Text Books:

- 1. S. Ross, "A First Course in Probability", Pearson Education, 2012.
- 2. D. Stirzaker, "Elementary Probability", Cambridge University Press, Cambridge, 2003.

- 1. K. L. Chung, F. AitSahlia, "Elementary Probability Theory", Undergraduate Texts in Mathematics. Springer-Verlag, 2003.

- 3. W. Feller, "An Introduction to Probability Theory and its Applications Vol. 1 and Vol. 2", John Wiley & Sons, 1968, 1971.

Course Title	: Complex Analysis
Course Code	: MA709
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

Learning the concept of (complex) differentiation and integration of functions defined on the complex plane and their properties.

Course Contents:

Algebraic and geometric representation of complex numbers; elementary functions including the exponential functions and its relatives (log, cos, sin, cosh, sinh, etc.); concept of holomorphic (analytic) functions, complex derivative and the Cauchy-Riemann equations; harmonic functions. Conformal Mapping, Linear Fractional Transformations, Complex line integrals and Cauchy Integral formula, Representation of holomorpic functions in terms of power series, Morera's theorem, Cauchy estimates and Liouville's theorem, zeros of holomorphic functions, Uniform limits of holomorphic functions. Behaviour of holomorphic function near an isolated singularity, Laurent expansions, Counting zeros and poles, Argument principle, Rouche's theorem, Calculus of residues and evaluation of integrals using contour integration. The Open Mapping theorem, Maximum Modulus Principle, Schwarz Lemma.

Text Books:

- 1. J. B. Conway, "Functions of One Complex Variable", Narosa Publishing House, 2002.
- 2. R. E. Greene, S. G. Krantz, "Function Theory of One Complex Variable", American Mathematical Society, 2011.

- 1. W. Rudin, "Real and Complex Analysis", Tata McGraw-Hill, 2013.
- 2. L. V. Ahlfors, "Complex Analysis", Tata McGraw-Hill, 2013.
- 3. T. W. Gamelin, "Complex Analysis", Undergraduate Texts in Mathematics, Springer, 2006.
- 4. E. M. Stein, R. Shakarchi, "Complex Analysis", Princeton University Press, 2003.

Course Title	: Graph Theory
Course Code	: MA710
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)
Contact Hours	: 56(including tutorials)

Understanding the fundamentals of graph theory and learning the structure of graphs and techniques used to analyze different problems

Course Contents:

Graphs, subgraphs, graph isomorphisms, degree sequence, paths, cycles, trees, bipartite graphs, Hamilton cycles, Euler tours, directed graphs, matching, Tutte's theorem, connectivity, Menger's theorem, planar graphs, Kuratowski's theorem, vertex and edge colouring of graphs, network flows, max-flow min-cut theorem, Ramsey theory for graphs, matrices associated with graphs.

Text Book:

1. R. Diestel, "Graph Theory", Graduate Texts in Mathematics, 173. Springer, 2010.

- 1. B. Bollobas, "Modern Graph Theory", Graduate Texts in Mathematics, 184. Springer-Verlag, 1998.
- 2. F. Harary, "Graph Theory", Addison-Wesley Publishing Co., 1969.
- 3. J. A. Bondy, U. S. R. Murty, "Graph Theory", Graduate Texts in Mathematics, 244. Springer, 2008.

Course Title	: Functional Analysis
Course Code	: MA801
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

Understanding the concept of normed linear space and various properties of operators defined on them.

Course Contents:

Normed linear spaces and continuous linear transformations, Hahn-Banach theorem (analytic and geometric versions), Baire's theorem and its consequences – three basic principles of functional analysis (open mapping theorem, closed graph theorem and uniform boundedness principle), Computing the dual of wellknown Banach spaces, Hilbert spaces, Riesz representation theorem, Adjoint operator, Compact operators, Spectral theorem for compact self adjoint operators.

Text Books:

- 1. J. B. Conway, "A Course in Functional Analysis", Graduates Texts in Mathematics 96, Springer, 2006.
- 2. B. Bollobás, "Linear Analysis", Cambridge University Press, 1999.

References:

1. G. F. Simmons, "Introduction to Topology and Modern Analysis", Tata McGraw-Hill, 2013.

: Module Theory
: MA802
: 8 Credits
: Core
: 56(including tutorials)

Understanding of the basic theory of modules, category and functors, algebras.

Course Contents:

Modules, submodules, module homomorphisms, quotient modules, isomorphism theorems, Direct Sum of modules, finitely generated modules, Free modules, structure theorem of finitely generated modules over PID. Tensor product of modules.

Over commutative rings with identity: Categories and Functors, exact functors, Hom and Tensor functors, Localization of modules, Direct and Inverse Limit of modules, Projective, Injective and Flat modules, Ext, Tor. Algebras, Tensor Algebras, Symmetric Algebras, Exterior Algebras, Determinants. Length of Modules, Noetherian and Artinian modules, Hilbert Basis Theorem.

Text Books:

- 1. Dummit, D.S.; Foote, R.M.; Abstract Algebra, Third Edition, John Wiley & Sons.
- 2. Rotman, J.; An Introduction to Homological Algebra, Springer, 2009.
- 3. Sing, Balwant; Basic Commutative Algebra, World Scientific, 2011.

- 1. Lang, S.; Algebra, Revised Third Edition, Springer, GTM 211.
- 2. Weibel, Charles A.; An Introduction to Homological Algebra, Cambridge University Press, 1995.
- 3. Atiyah, M.F.; McDonald, I.G.; Introduction to Commutative Algebra, CRC Press, 2018.

Course Title	: Topology
Course Code	: MA803
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

- Learning abstract notion of topological spaces, continuous functions between topological spaces, Ursysohn Lemma, Tietze extension theorem and Tychonoff Theorem which they have learned in a particular setting of "Metric Space"
- Lerning basic notions of fundamental groups and covering spaces and some of its applications

Course Contents:

Topological Spaces, Open and closed sets, Interior, Closure and Boundary of sets, Basis for Topology, Product Topology, Subspace Topology, Metric Topology, Compact Spaces, Locally compact spaces, Continuous functions, Open map, Homeomorphisms, Function Spaces, Separation Axioms: T1, Hausdorff, regular, normal spaces; Uryshon's lemma, Tietze Extension Theorem, One point compactification, Connected Spaces, Path Connected Spaces, Quotient Topology, Homotopic Maps, Deformation Retract, Contractible Spaces, Fundamental Group, The Brouwer fixed-point theorem.

Text Books:

- 1. J. R.Munkres, "Topology", Prentice-Hall of India, 2013.
- 2. M. A. Armstrong, "Basic Topology", Undergraduate Texts in Mathematics, Springer-Verlag, 1983.

- J. L. Kelley, "General Topology", Graduate Texts in Mathematics, No. 27. Springer-Verlag, New York-Berlin, 1975.
- 2. K. Jänich, "Topology", Undergraduate Texts in Mathematics. Springer-Verlag, 1984.
- 3. W. G. Chinn, N. E. Steenrod, "First concepts of Topology", The Mathematical Association of America, 1978.

Course Title	: Geometry of Curves and Surfaces
Course Code	: MA804
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

Knowledge on curves and surfaces, manifold and vector field some application on geometry of surfaces.

Course Contents:

Curves in two and three dimensions, Curvature and torsion for space curves, Existence theorem for space curves, Serret-Frenet formula for space curves, Jacobian theorem, Surfaces in \mathbb{R}^3 as 2-dimensional manifolds, Tangent spaces and derivatives of maps between manifolds, Geodesics, First fundamental form, Orientation of a surface, Second fundamental form and the Gauss map, Mean curvature, Gaussian Curvature, Differential forms, Integration on surfaces, Stokes formula, Gauss-Bonnet theorem.

Text Books:

- 1. M. P. Do Carmo, "Differential Geometry of Curves and Surfaces", Prentice Hall, 1976.
- 2. Andrew Pressley, "Elementary Differential Geometry", Springer, 2010.

- 1. M. P. Do Carmo, "Differential Forms and Applications", Springer, 1994.
- 2. J. A. Thorpe, "Elementary Topics in Differential Geometry", Undergraduate texts in mathematics, Springer, 2011.

Course Title	: Partial Differential Equations
Course Code	: MA805
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

- Learning the explicit representations of solutions of four important classes of PDEs, namely, Transport equations, Heat equation, Laplace equation and wave equation for initial value problems.
- Learning the properties of solutions of these equations such as mean value property, maximum principles and regularity.
- Understanding Cauchy-Kowalevski Theorem and uniqueness theorem of Holmgreen for quasilinear equations.

Course Contents:

Classification of Partial Differential Equations, Cauchy Problem, Cauchy-Kowalevski Theorem, Lagrange-Green identity, The uniquness theorem of Holmgren, Transport equation: Initial value problem, nonhomogeneous problem. Laplace equation: Fundamental solution, Mean Value formula, properties of Harmonic functions, Green's function, Energy methods, Harnack's inequality. Heat Equation: Fundamental solution, Mean value formula, properties of solutions. Wave equation: Solution by spherical means, Nonhomogeneous problem, properties of solutions.

Textbooks:

- 1. L. C. Evans, "Partial Differential Equations", Graduate Studies in Mathematics 19, American Mathematical Society, 2010.
- 2. F. John, "Partial Differential Equations", Springer International Edition, 2009.

- 1. G. B. Folland, "Introduction to Partial Differential Equations", Princeton University Press, 1995.
- 2. S. Kesavan, "Topics in Functional Analysis and Applications", John Wiley & Sons, 1989.

: Field Theory
: MA806
: 8 Credits
: Core
: 56(including tutorials)

Learning the basic properties of fields including the fundamental theorem of Galois theory.

Course Contents:

Field extensions, algebraic extensions, Ruler and compass constructions, splitting fields, algebraic closures, separable and inseparable extensions, cyclotomic polynomials and extensions, automorphism groups and fixed fields, Galois extensions, Fundamental theorem of Galois theory, Fundamental theorem of algebra, Finite fields, Galois group of polynomials, Computations of Galois groups over rationals, Solvable groups, nilpotent groups, Solvability by radicals, Transcendental extensions.

Text Book:

1. D. S. Dummit, R. M. Foote, "Abstract Algebra", Wiley-India edition, 2013.

- 1. I. N. Herstein, "Topics in Algebra", Wiley-India edition, 2013.
- 2. M. Artin, "Algebra", Prentice-Hall of India, 2007.
- 3. J. Rotman, "Galois Theory", Universitext, Springer-Verlag, 1998.
- 4. S. Lang, "Algebra", Revised Third Edition. Spinger.

Course Title	: Algebraic Topology
Course Code	: MA901
Credits	: 8 Credits
Course Category	: Core
Contact Hours	: 56(including tutorials)

- Understanding the basics of fundamental group (π_1) and singular homology.
- Learning different techniques to compute the fundamental group such as homotopy invariance and Van-Kampen Theorem.
- Learning different techniques to compute singular homology of a space, including homotopy invariance, Mayer-Vietoris, excision, long exact sequence.

Course Contents:

Homotopy Theory: Simply Connected Spaces, Covering Spaces, Universal Covering Spaces, Deck Transformations, Path lifting lemma, Homotopy lifting lemma, Group Actions, Properly discontinuous action, free groups, free product with amalgamation, Seifert-Van Kampen Theorem, Borsuk-Ulam Theorem for sphere, Jordan Separation Theorem. Homology Theory: Simplexes, Simplicial Complexes, Triangulation of spaces, Simplicial Chain Complexes, Simplicial Homology, Singular Chain Complexes, Cycles and Boundary, Singular Homology, Relative Homology, Short Exact Sequences, Long Exact Sequences, Mayer-Vietoris sequence, Excision Theorem, Invariance of Domain.

Text Books:

- 1. J. R. Munkres, "Topology", Prentice-Hall of India, 2013.
- 2. A. Hatcher, "Algebraic Topology", Cambridge University Press, 2009.

References:

Course Title	: Representations of Finite Groups
Course Code	: MA851
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Learning the representation of finite groups via character theory.

Course Contents:

Group representations, Maschke's theorem and completely reducibility, Characters, Inner product of Characters, Orthogonality relations, Burnside's theorem, induced characters, Frobenius reciprocity, induced representations, Mackey's Irreducibility Criterion, Character table of some well-known groups, Representation theory of the symmetric group: partitions and tableaux, constructing the irreducible representations.

Text Book:

1. G. James, M. Liebeck, "Representations and Characters of Groups", Cambridge University Press, 2010.

Course Title	: Advanced Complex Analysis
Course Code	: MA852
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

- Leraning some important theorems in complex analysis such as Riemann mapping theorem, Weirstrass factorization theorem, Runge's theorem, Hardamard factorization theorem, Little Picard's theorem and Great Picard's theorem.
- Learning some basic techniques of harmonic functions and characterization of Dirichlet Region.

Course Contents:

Review of basic Complex Analysis: Cauchy-Riemann equations, Cauchy's theorem and estimates, power series expansions, maximum modulus principle, Classification of singularities and calculus of residues. Space of continuous functions, Arzela's theorem, Spaces of analytic functions, Spaces of meromorphic functions, Riemann mapping theorem, Weierstrass Factorization theorem, Runge's theorem, Simple connectedness, Mittag-Leffler's theorem, Analytic continuation, Schwarz reflection principle, Mondromy theorem, Jensen's formula, Genus and order of an entire function, Hadamard factorization theorem, Little Picard theorem, Great Picard theorem, Harmonic functions.

- 1. L. V. Ahlfors, "Complex Analysis", Tata McGraw-Hill, 2013.

Course Title	: Advanced Functional Analysis
Course Code	: MA853
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Understanding the concept of topological vector space, as a generalisation of normed linear spaces, and various properties of operators defined on them.

Course Contents:

Definition and examples of topological vector spaces (TVS) and locally convex spaces (LCS); Linear operators; Hahn-Banach Theorems for TVS/ LCS (analytic and geometric forms); Uniform boundedness principle; Open mapping theorem; Closed graph theorem; Weak and weak* vector topologies; Bipolar theorem; dual of LCS spaces; Krein-Milman theorem for TVS; Krien-Smulyan theorem for Banach spaces; Inductive and projective limit of LCS.

- 1. W. Rudin, "Functional Analysis", Tata McGraw-Hill, 2007.

- 3. J. B. Conway, "A Course in Functional Analysis", Graduates Texts in Mathematics 96, Springer, 2006.

Course Title	: Introduction to Stochastic Processes
Course Code	: MA854
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Understanding the theory of discrete time and continuous time Markov chains.

Course Contents:

Discrete Markov chains with countable state space; Classification of states: recurrences, transience, periodicity. Stationary distributions, reversible chains, Several illustrations including the Gambler's Ruin problem, queuing chains, birth and death chains etc. Poisson process, continuous time Markov chain with countable state space, continuous time birth and death chains.

Course Title	: Algebraic Geometry
Course Code	: MA855
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

- Learning the fundamentals of classical algebraic geometry.
- Learning about the theory of Riemann surfaces, divisors, line bundles, Chern Classes and the Riemann Roch Theorem.

Course Contents:

Prime ideals and primary decompositions, Ideals in polynomial rings, Hilbert Basis theorem, Noether normalisation lemma, Hilbert's Nullstellensatz, Affine and Projective varieties, Zariski Topology, Rational functions and morphisms, Elementary dimension theory, Smoothness, Curves, Divisors on curves, Bezout's theorem, Riemann-Roch for curves, Line bundles on Projective spaces.

: Algebraic Graph Theory
: MA856
: 8 Credits
: Elective
: 56 (including tutorials)

Learning the different algebraic techniques used in the study of the graphs

Course Contents:

Adjacency matrix of a graph and its eigenvalues, Spectral radius of graphs, Regular graphs and Line graphs, Strongly regular graphs, Cycles and Cuts, Laplacian matrix of a graph, Algebraic connectivity, Laplacian spectral radius of graphs, Distance matrix of a graph, General properties of graph automorphisms, Transitive and Arc-tranisitve graphs, Symmetric graphs.

- 1. N. Biggs, "Algebraic Graph Theory", Cambridge University Press, 1993.

Course Title	: Algebraic Number Theory
Course Code	: MA857
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Understanding the basic properties of number fields, computation of class numbers and zeta functions.

Course Contents:

Number Fields and Number rings, prime decomposition in number rings, Dedekind domains, Ideal class group, Galois theory applied to prime decomposition, Gauss reciprocity law, Cyclotomic fields and their ring of integers, finiteness of ideal class group, Dirichlet unit theorem, valuations and completions of number fields, Dedekind zeta function and distribution of ideal in a number ring.

Course Title	: Algorithm
Course Code	: MA858
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

- Learning data structure, design and analysis algorithms.
- Understanding some important algorithms like sortings, graph theoretics, polynomial related and optimization related.

Course Contents:

Algorithm analysis, asymptotic notation, probabilistic analysis; Data Structure: stack, queues, linked list, hash table, binary search tree, red-black tree; Sorting: heap sort, quick sort, sorting in linear time; Algorithm design: divide and conquer, greedy algorithms, dynamic programming; Algebraic algorithms: Winograd's and Strassen's matrix multiplication algorithm, evaluation of polynomials, DFT, FFT, efficient FFT implementation; Graph algorithms: breadth-first and depth-first search, minimum spanning trees, single-source shortest paths, all-pair shortest paths, maximum flow; NP-completeness and approximation algorithms.

- 1. A. V. Aho, J. E. Hopcroft, J. D. Ullman, "The Design and Analysis of Computer Algorithms", Addison-Wesley Publishing Co., 1975.

Course Title	: Cryptology
Course Code	: MA859
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

- Learning the basics of cryptography and cryptanalysis.
- Understanding the theory and design of cryptographic schemes like stream ciphers, block ciphers and public key ciphers like RSA, El-Gamal, elliptic curve cryptosystem.
- Learning about data authentication, integrity and secret sharing.

Course Contents:

Overview of Cryptography and cryptanalysis, some simple cryptosystems (e.g., shift, substitution, affine, knapsack) and their cryptanalysis, classification of cryptosystems, classification of attacks; Information Theoretic Ideas: Perfect secrecy, entropy; Secret key cryptosystem: stream cipher, LFSR based stream ciphers, cryptanalysis of stream cipher (e.g., correlation attack, algebraic attacks), block cipher, DES, linear and differential cryptanalysis, AES; Public-key cryptosystem: Implementation and cryptanalysis of RSA, ElGamal public-key cryptosystem, Discrete logarithm problem, elliptic curve cryptography; Data integrity and authentication: Hash functions, message authentication code, digital signature scheme, ElGamal signature scheme; Secret sharing: Shamir's threshold scheme, general access structure and secret sharing.

- 1. D. R. Stinson, "Cryptography: Theory And Practice", Chapman & Hall/CRC, 2006.
- 2. A. J. Menezes, P. C. van Oorschot, S. A. Vanstone, "Handbook of Applied Cryptography", CRC Press, 1997.

Course Title	: Finite Fields
Course Code	: MA860
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Understanding the structures of finite fields, factorization of polynomials, some applications towards cryptography, coding theory and combinatorics.

Course Contents:

Structure of finite fields: characterization, roots of irreducible polynomials, traces, norms and bases, roots of unity, cyclotomic polynomial, representation of elements of finite fields, Wedderburn's theorem; Polynomials over finite field: order of polynomials, primitive polynomials, construction of irreducible polynomials, binomials and trinomials, factorization of polynomials over small and large finite fields, calculation of roots of polynomials; Linear recurring sequences: LFSR, characteristic polynomial, minimal polynomial, characterization of linear recurring sequences, Berlekamp-Massey algorithm; Applications of finite fields: Applications in cryptography, coding theory, finite geometry, combinatorics.

- 4. Z-X. Wan, "Finite Fields and Galois Rings", World Scientific Publishing Co., 2012.

Course Title	: Information and Coding Theory
Course Code	: MA861
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

- Learning how to measure information and encoding of information.
- Understanding the theory and techniques of error correcting codes like Reed-Muller codes, BCH codes, Reed-Solomon codes, Algebraic codes.

Course Contents:

Information Theory: Entropy, Huffman coding, Shannon-Fano coding, entropy of Markov process, channel and mutual information, channel capacity;

Error correcting codes: Maximum likelihood decoding, nearest neighbour decoding, linear codes, generator matrix and parity-check matrix, Hamming bound, Gilbert-Varshamov bound, binary Hamming codes, Plotkin bound, nonlinear codes, Reed-Muller codes, Cyclic codes, BCH codes, Reed-Solomon codes, Algebraic codes.

- 1. R. W. Hamming, "Coding and Information Theory", Prentice-Hall, 1986.
- N. J. A. Sloane, F. J. MacWilliams, "Theory of Error Correcting Codes", North-Holland Mathematical Library 16, North-Holland, 2007.

- 5. S. Lin, "An Introduction to Error-Correcting Codes", Prentice-Hall, 1970.

Course Title	: Mathematical Logic
Course Code	: MA862
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

- Learning the propositional logic and first order theory.
- Understanding the completeness and compactness theorems with Godel's incompleteness theorem.

Course Contents:

Propositional Logic, Tautologies and Theorems of propositional Logic, Tautology Theorem. First Order Logic: First order languages and their structures, Proofs in a first order theory, Model of a first order theory, validity theorems, Metatheorems of a first order theory, e. g., theorems on constants, equivalence theorem, deduction and variant theorems etc. Completeness theorem, Compactness theorem, Extensions by definition of first order theories, Interpretations theorem, Recursive functions, Arithmatization of first order theories, Godel's first Incompleteness theorem, Rudiments of model theory including Lowenheim-Skolem theorem and categoricity.

- 1. J. R. Shoenfield, "Mathematical logic", Addison-Wesley Publishing Co., 1967.
- 2. E. Mendelson, "Introduction to Mathematical Logic", Chapman & Hall, 1997.

Course Title	: Nonlinear Analysis
Course Code	: MA863
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

- Learning calculus in Banach Spaces, degree theory and it's application for fixed point theorems of Brouwer and Schauder.
- Learning homotopy, homotopy extension and invariance theorems and its applications.

Course Contents:

Calculus in Banach spaces, inverse and multiplicit function theorems, fixed point theorems of Brouwer, Schauder and Tychonoff, fixed point theorems for nonexpansive and set-valued maps, predegree results, compact vector fields, homotopy, homotopy extension, invariance theorems and applications.

Course Title	: Operator Theory
Course Code	: MA864
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Learning the concepts of C*-algebra, von-Neuman algebra and to eplitz operators and the notion of index for Fredholm operators.

Course Contents:

Compact operators on Hilbert Spaces. (a) Fredholm Theory (b) Index, C*-algebras - noncommutative states and representations, Gelfand-Neumark representation theorem, Von-Neumann Algebras; Projections, Double Commutant theorem, L^{∞} functionalCalculus, Toeplitz operators.

Course Title	: Theory of Computation
Course Code	: MA865
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

- Learning Automata and Language theory by studying automata and context free language.
- Learning Computability theory by studying Turing machine and halting problem.
- Learning Complexity theory by studying P and NP class problems.

Course Contents:

Automata and Language Theory: Finite automata, regular expression, pumping lemma, context free grammar, context free languages, Chomsky normal form, push down automata, pumping lemma for CFL; Computability: Turing machines, Churh-Turing thesis, decidability, halting problem, reducibility, recursion theorem; Complexity: Time complexity of Turing machines, Classes P and NP, NP completeness, other time classes, the time hierarchy.

: Abstract Harmonic Analysis
: MA866
: 8 Credits
: Elective
: 56 (including tutorials)

Knowledge on Haar measure, convolution structure on Lie group with emphasize to harmonic analysis on the groups Circle and real line.

Course Contents:

Topological Groups: Basic properties of topological groups, subgroups, quotient groups. Examples of various matrix groups. Connected groups. Haar measure: Discussion of Haar measure without proof on \mathbb{R} , \mathbb{T} , \mathbb{Z} and simple matrix groups, Convolution, the Banach algebra $L^1(G)$ and convolution with special emphasis on $L^1(\mathbb{R})$, $L^1(\mathbb{T})$ and $L^1(\mathbb{Z})$. Basic Representation Theory: Unitary representation of groups, Examples and General properties, The representations of Group and Group algebras, C^* -algebra of a group, GNS construction, Positive definite functions, Schur's Lemma. Abelian Groups: Fourier transform and its properties, Approximate identities in $L^1(G)$, Classical Kernels on \mathbb{R} , The Fourier inversion Theorem, Plancherel theorem on \mathbb{R} , Plancherel measure on \mathbb{R} , \mathbb{T} , \mathbb{Z} . Dual Group of an Abelian Group: The Dual group of a locally compact abelian group, Computation of dual groups for \mathbb{R} , \mathbb{T} , \mathbb{Z} , Pontryagin's Duality theorem.

Course Title	: Advanced Number Theory
Course Code	: MA867
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56 (including tutorials)

Learning *p*-adic numbers, quadratic forms, Dirichlet series and modular forms.

Course Contents:

Review of Finite fields, Gauss Sums and Jacobi Sums, Cubic and biquadratic reciprocity, Polynomial equations over finite fields, Theorems of Chevally and Warning, Quadratic forms over prime fields. Ring of *p*-adic integers, Field of *p*-adic numbers, completion, *p*-adic equations, Hensel's lemma, Hilbert symbol, Quadratic forms with *p*-adic coefficients. Dirichlet series: Abscissa of convergence and absolute convergence, Riemann Zeta function and Dirichlet *L*-functions. Dirichlet's theorem on primes in arithmetic progression. Functional equation and Euler product for *L*-functions. Modular Forms and the Modular Group, Eisenstein series, Zeros and poles of modular functions, Dimensions of the spaces of modular forms, The *j*-invariant *L*-function associated to modular forms, Ramanujan τ function.

Course Title	: Advanced Probability
Course Code	: MA868
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Learning about measure theoretic probability starting from probability spaces to theory of martingales.

Course Contents:

Probability spaces, Random Variables, Independence, Zero-One Laws, Expectation, Product spaces and Fubini's theorem, Convergence concepts, Law of large numbers, Kolmogorov three-series theorem, Levy-Cramer Continuity theorem, CLT for i.i.d. components, Infinite Products of probability measures, Kolmogorov's Consistency theorem, Conditional expectation, Discrete parameter martingales with applications.

Course Title	: Algebraic Combinatorics
Course Code	: MA869
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Learning the use of different algebraic technique to study the combinatorial problems

Course Contents:

Catalan Matrices and Orthogonal Polynomials, Catalan Numbers and Lattice Paths, Combinatorial Interpretation of Catalan Numbers, Symmetric Polynomials and Functions, Schur Functions, Jacobi-Trudi identity, RSK Algorithm, Standard Tableaux, Young diagrams and *q*-binomial coefficients, Plane Partitions, Group actions on boolean algebras, Enumeration under group action, Walks in graphs, Cubes and the Radon transform, Sperner property, Matrix-Tree Theorem.

Course Title	: Foundations of Cryptography
Course Code	: MA870
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56 (including tutorials)

Understanding the theoretical study of cryptography which puts foundation for the study and design of real-life cryptography.

Course Contents:

Introduction to cryptography and computational model, computational difficulty, pseudorandom generators, zero-knowledge proofs, encryption schemes, digital signature and message authentication schemes, cryptographic protocol.

- 1. O. Goldreich, "Foundations of Cryptography Vol. I and Vol. II", Cambridge University Press, 2001, 2004.

Course Title	: Incidence Geometry
Course Code	: MA871
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Understanding different kinds of incidence structures such as projective spaces, affine spaces, generalized quadrangles, polar spaces and quadratic sets.

Course Contents:

Definitions and Exampleas, projective planes, affine planes, projective spaces, affine spaces, collineations of projective and affine spaces, fundamental theorem of projective and affine spaces, polar spaces, generalized quadrangles, quadrics and quadratic sets.

- 1. J. Ueberberg, "Foundations of Incidence Geometry", Springer Monographs in Mathematics, Springer, 2011.

Course Title	: Lie Algebras
Course Code	: MA872
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Understanding the basics of Lie Algebra

Course Contents:

Definitions and Examples, Derivations, Ideals, Homomorphisms, Nilpotent Lie Algebras and Engel's theorem, Solvable Lie Algebras and Lie's theorem, Jordan decomposition and Cartan's criterion, Semisimple Lie algebras, Casimir operator and Weyl's theorem, Representations of sl(2, F), Root space decomposition, Abstract root systems, Weyl group and Weyl chambers, Classification of irreducible root systems, Abstract theory of weights, Isomorphism and conjugacy theorems, Universal enveloping algebras and PBW theorem, Representation theory of semi-simple Lie algebras, Verma modules and Weyl character formula.

- 1. J. E. Humphreys, "Introduction to Lie Algebras and Representation Theory", Graduate Texts in Mathematics 9, Springer-Verlag, 1978.

- 4. N. Jacobson, "Lie Algebras", Dover Publications, 1979.

Course Title	: Advanced Partial Differential Equations
Course Code	: MA873
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Learning the basics of distribution Theory, Sobolev Spaces and their properties. Course Contents:

Distribution Theory, Sobolev Spaces, Embedding theorems, Trace theorem. Dirichlet, Neumann and Oblique derivative problem, Weak formulation, Lax–Milgram, Maximum Principles– Weak and Strong Maximum Principles, Hopf Maximum Principle, Alexandroff-Bakelmann-Pucci Estimate.

- 1. L. C. Evans, "Partial Differential Equations", Graduate Studies in Mathematics 19, American Mathematical Society, 2010.

Course Title	: Random Graphs
Course Code	: MA874
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Learning random graphs and their applications.

Course Contents:

Models of random graphs and of random graph processes; illustrative examples; random regular graphs, configuration model; appearance of the giant component small subgraphs; long paths and Hamiltonicity; coloring problems; eigenvalues of random graphs and their algorithmic applications; pseudo-random graphs.

- 1. N. Alon, J. H. Spencer, "The Probabilistic Method", John Wiley & Sons, 2008

: Randomized Algorithms and Probabilistic Methods
: MA875
: 8 Credits
: Elective
: 56 (including tutorials)

Learning how to use probabilistic techniques to different areas of mathematics and computer science.

Course Contents:

Inequalities of Markov and Chebyshev (median algorithm), first and second moment method (balanced allocation), inequalities of Chernoff (permutation routing) and Azuma (chromatic number), rapidly mixing Markov chains (random walk in hypercubes, card shuffling), probabilistic generating functions (random walk in *d*dimensional lattice)

- 1. R. Motwani, P. Raghavan, "Randomized Algorithms", Cambridge University Press, 2004.
- 2. M. Mitzenmacher, E. Upfal, "Probability and Computing: Randomized algorithms and probabilistic analysis", Cambridge University Press, 2005.

Course Title	: Introduction to Manifolds
Course Code	: MA876
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56 (including tutorials)

Knowledge of smooth manifolds, tangent and cotangent spaces, vector bundles, (co)tangent bundles, vector fields, differential forms, exterior differentiation, De-Rham cohomology, integration on manifolds, homotopy invariance of De-Rham cohomology and the statement of Poincare Duality.

Course Contents:

Differentiable manifolds and maps: Definition and examples, Inverse and implicit function theorem, Submanifolds, immersions and submersions. The tangent and cotangent bundle: Vector bundles, (co)tangent bundle as a vector bundle, Vector fields, flows, Lie derivative. Differential forms and Integration: Exterior differential, closed and exact forms, Poincaré lemma, Integration on manifolds, Stokes theorem, De Rham cohomology.

- 1. Michael Spivak, "A comprehensive introduction to differential geometry", Vol. 1, 3rd edition, 1999.
- 2. Frank Warner, "Foundations of differentiable manifolds and Lie groups", Springer-Verlag, 2nd edition, 1983.

Course Title	: Commutative Algebra
Course Code	: MA877
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Understanding the various properties of commutative rings, various class of commutative rings, and dimension theory.

Course Contents:

Commutative rings, ideals, operations on ideals, prime and maximal ideals, nilradicals, Jacobson radicals, extension and contraction of ideals, Modules, free modules, projective modules, exact sequences, tensor product of modules, Restriction and extension of scalars, localization and local rings, extended and contracted ideals in rings of fractions, Noetherian modules, Artinian modules, Primary decompositions and associate primes, Integral extensions, Valuation rings, Discrete valuation rings, Dedekind domains, Fractional ideals, Completion, Dimension theory.

Course Title	: Algebraic Computation
Course Code	: MA878
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

It is a unique style of course where the mathematics students having interest in computation can learn to compute different algebraic problems in computer. Here students will learn the computation of the problems related (i) linear algebra, (ii) non-linear system of equations like Grobner bases, (iii) polynomial, (iv) algebraic number theory and (v) elliptic curve.

Course Contents:

Linear algebra and lattices: Asymptotically fast matrix multiplication algorithms, linear algebra algorithms, normal forms over fields, Lattice reduction; Solving system of non-linear equations: Gröbner basis, Buchberger's algorithms, Complexity of Gröbner basis computation; Algorithms on polynomials: GCD, Barlekamp-Massey algorithm, factorization of polynomials over finite field, factorization of polynomials over \mathbb{Z} and \mathbb{Q} ; Algorithms for algebraic number theory: Representation and operations on algebraic numbers, trace, norm, characteristic polynomial, discriminant, integral bases, polynomial reduction, computing maximal order, algorithms for quadratic fields; Elliptic curves: Implementation of elliptic curve, algorithms for elliptic curves.

- 1. A. V. Aho, J. E. Hopcroft, J. D. Ullman, "The Design and Analysis of Computer Algorithms", Addison-Wesley Publishing Co., 1975.
- 2. H. Cohen, "A Course in Computational Algebraic Number Theory", Graduate Texts in Mathematics 138, Springer-Verlag, 1993.
- D. Cox, J. Little, D. O'shea, "Ideals, Varieties and Algorithms: An introduction to computational algebraic geometry and commutative algebra", Undergraduate Texts in Mathematics, Springer-verlag, 2007.

Course Title	: Analytic Number Theory
Course Code	: MA879
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Learning the elementary properties of Dirichlet series and distribution of primes.

Course Contents:

Arithmetic functions, Averages of arithmetical functions, Distribution of primes, finite abelian groups and characters, Gauss sums, Dirichlet series and Euler products, Reimann Zeta function, Dirichlet L-functions, Analytic proof of the prime number theorem, Dirichlet Theorem on primes in arithmetic progression.

- 1. T. M. Apostol, "Introduction to Analytic Number Theory", Springer International Student Edition, 2000.
- 2. K. Chandrasekharan, "Introduction to Analytic Number Theory", Springer-Verlag, 1968.
- 3. H. Iwaniec, E. Kowalski, "Analytic Number Theory", American Mathematical Society Colloquium Publications 53, American Mathematical Society, 2004.

Course Title	: Classical Groups
Course Code	: MA880
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Understanding the basic facts about classical groups defined over fields such as General Linear groups, Special Linear groups, Symplectic groups, Orthogonal groups and Unitary groups.

Course Contents:

General and special linear groups, bilinear forms, Symplectic groups, symmetric forms, quadratic forms, Orthogonal geometry, orthogonal groups, Clifford algebras, Hermitian forms, Unitary spaces, Unitary groups.

- 1. L. C. Grove, "Classical Groups and Geometric Algebra", Graduate Studies in Mathematics 39, American Mathematical Society, 2002.
- 2. E. Artin, "Geometric Algebra", John Wiley & sons, 1988.

Course Title	: Ergodic Theory
Course Code	: MA881
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Learning the basics of Ergodic Theory.

Course Contents:

Measure preserving systems; examples: Hamiltonian dynamics and Liouville's theorem, Bernoulli shifts, Markov shifts, Rotations of the circle, Rotations of the torus, Automorphisms of the Torus, Gauss transformations, Skew-product, Poincare Recurrence lemma: Induced transformation: Kakutani towers: Rokhlin's lemma. Recurrence in Topological Dynamics, Birkhoff's Recurrence theorem, Ergodicity, Weakmixing and strong-mixing and their characterizations, Ergodic Theorems of Birkhoff and Von Neumann. Consequences of the Ergodic theorem. Invariant measures on compact systems, Unique ergodicity and equidistribution. Weyl's theorem, The Isomorphism problem; conjugacy, spectral equivalence, Transformations with discrete spectrum, Halmos–von Neumann theorem, Entropy. The Kolmogorov-Sinai theorem. Calculation of Entropy. The Shannon Mc-Millan–Breiman Theorem, Flows. Birkhoff's ergodic Theorem and Wiener's ergodic theorem for flows. Flows built under a function.

Course Title	: Harmonic Analysis
Course Code	: MA882
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

knowldege on Fourier Series, Fourier transforms and celebrated differentiation theorem and important operators like Hilbert transform and Maximal function.

Course Contents:

Fourier series and its convergences, Dirichlet kernel, Frejer kernel, Parseval formula and its applications. Fourier transforms, the Schwartz space, Distribution and tempered distribution, Fourier Inversion and Plancherel theorem. Fourier analysis on L_p -spaces. Maximal functions and boundedness of Hilbert transform. Paley-Wiener Theorem for distribution. Poisson summation formula, Heisenberg uncertainty Principle, Wiener's Tauberian theorem.

Course Title	: Lie Groups and Lie Algebras - I
Course Code	: MA883
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Outcome of the Course: Learning the rudiments of Lie groups and irreducible representations of compact Lie groups parametrised by Weyl Character formula.

Course Contents:

General Properties: Definition of Lie groups, subgroups, cosets, group actions on manifolds, homogeneous spaces, classical groups. Exponential and logarithmic maps, Adjoint representation, Lie bracket, Lie algebras, subalgebras, ideals, stabilizers, center Baker-Campbell-Hausdorff formula, Lie's Theorems. Structure Theory of Lie Algebras: Solvable and nilpotent Lie algebras (with Lie/Engel theorems), semisimple and reductive algebras, invariant bilinear forms, Killing form, Cartan criteria, Jordan decomposition. Complex semisimple Lie algebras, Toral subalgebras, Cartan subalgebras, Root decomposition and root systems. Weight decomposition, characters, highest weight representations, Verma modules, Classification of irreducible finite-dimensional representations, BGG resolution, Weyl character formula.

Course Title	: Operator Algebras
Course Code	: MA884
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Learning the concepts and various structure theorems of C*-algebra and von-Neuman algebra.

Course Contents:

Banach algebras/C^{*}–algebras: Definition and examples; Spectrum of a Banach algebra; Gelfand transform; Gelfand-Naimark theorem for commutative Banach algebras/C^{*}-algebras; Functional calculus for C^{*}-algebras; Positive cone in a C^{*}-algebra; Existance of an approximate identity in a C^{*}-algebra; Ideals and Quotients of a C^{*}-algebra; Positive linear functionals on a C^{*}-algebra; GNS construction. Locally convex topologies on the algebras of bounded operators on a Hilbert space, von-Neumann's bi-commutant theorem; Kaplansky's density theorem. Ruan's characterization of Operator Spaces (if time permites).

: Representations of Linear Lie Groups
: MA885
: 8 Credits
: Elective
: 56(including tutorials)

Learning the first principles of representations and understanding the important examples of 3 different types of groups, viz., compact, nilpotent and solvable groups.

Course Contents:

Introduction to topological group, Haar measure on locally compact group, Representation theory of compact groups, Peter Weyl theorem, Linear Lie groups, Exponential map, Lie algebra, Invariant Differential operators, Representation of the group and its Lie algebra. Fourier analysis on SU(2) and SU(3). Representation theory of Heisenberg group. Representation of Euclidean motion group.

- 1. J. E. Humphreys, "Introduction to Lie algebras and representation theory", Springer-Verlag, 1978.

Course Title	: Harmonic Analysis on Compact Gr	oups
Course Code	: MA886	
Credits	: 8 Credits	
Course Category	: Elective	
Contact Hours	: 56(including tutorials)	

Knowledge on representation on compact lie groups with examples SU(2), SO(n).

Course Contents:

Review of General Theory: Locally compact groups, Computation of Haar measure on \mathbb{R} , \mathbb{T} , SU(2), SO(3) and some simple matrix groups, Convolution, the Banach algebra $L^1(G)$. Representation Theory: General properties of representations of a locally compact group, Complete reducibility, Basic operations on representations, Irreducible representations. Representations of Compact groups: Unitarilzibality of representations, Matrix coefficients, Schur's orthogonality relations, Finite dimensionality of irreducible representations of compact groups. Various forms of Peter-Weyl theorem, Fourier analysis on Compact groups, Character of a representation. Schur's orthogonality relations among characters. Weyl's Chracter formula, Computing the Unitary dual of SU(2), SO(3); Fourier analysis on SO(n).

Course Title	: Modular Forms of One Variable
Course Code	: MA887
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Learning modular forms over 2 and their congruence subgroups, and their Hecke theory.

Course Contents:

 $SL_2(\mathbb{Z})$ and its congruence subgroups, Modular forms for $SL_2(\mathbb{Z})$, Modular forms for congruence subgroups, Modular forms and differential operators, Hecke theory, L-series, Theta functions and transformation formula.

- 1. J.-P. Serre, "A Course in Arithmetic", Graduate Texts in Mathematics 7, Springer-Verlag, 1973.

Course Title	: Elliptic Curvese
Course Code	: MA888
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)
Contact Hours	· Julians

Learning elliptic curves and the structure of their rational points.

Course Contents:

Congruent numbers, Elliptic curves, Elliptic curves in Weierstrass form, Addition law, Mordell–Weil Theorem, Points of finite order, Points over finite fields, Hasse-Weil *L*-function and its functional equation, Complex multiplication.

- 1. J. H. Silverman, J. Tate, "Rational Points on Elliptic Curves", Undergraduate Texts in Mathematics, Springer-Verlag, 1992.

Course Title	: Brownian Motion and Stochastic Calculus
Course Code	: MA889
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Learning about the theory of Brownian motion and it applications to stochastic differential equations.

Course Contents:

Brownian Motion, Martingale, Stochastic integrals, extension of stochastic integrals, stochastic integrals for martingales, Itô's formula, Application of Itô's formula, stochastic differential equations.

- 1. H. H. Kuo, "Introduction to Stochastic Integration", Springer, 2006.

Course Title	: Differentiable Manifolds and Lie Groups
Course Code	: MA890
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

- Understanding the fundamentals of Lie groups and Lie Algebras.
- Learning about (bi)invariant vector fields, integration on Lie Groups, Cartan's Theorem.

Course Contents:

Review of Several variable Calculus: Directional Derivatives, Inverse Function Theorem, Implicit function Theorem, Level sets in \mathbb{R}^n , Taylor's theorem, Smooth function with compact support. Manifolds: Differentiable manifold, Partition of Unity, Tangent vectors, Derivative, Lie groups, Immersions and submersions, Submanifolds. Vector Fields: Left invariant vector fields of Lie groups, Lie algebra of a Lie group, Computing the Lie algebra of various classical Lie groups. Flows: Flows of a vector field, Taylor's formula, Complete vector fields. Exponential Map: Exponential map of a Lie group, One parameter subgroups, Frobenius theorem (without proof). Lie Groups and Lie Algebras: Properties of Exponential function, product formula, Cartan's Theorem, Adjoint representation, Uniqueness of differential structure on Lie groups. Homogeneous Spaces: Various examples and Properties. Coverings: Covering spaces, Simply connected Lie groups, Universal covering group of a connected Lie group. Finite dimensional representations of Lie groups and Lie algebras.

Course Title	: Lie Groups and Lie Algebras - II
Course Code	: MA891
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

- Learning the representation theory of compact Lie groups and the group SL(2,C).
- Learning classifications of all simple Lie algebras through root system.

Course Contents:

General theory of representations, operations on representations, irreducible representations, Schur's lemma, Unitary representations and complete reducibility. Compact Lie groups, Haar measure on compact Lie groups, Schur's Theorem, characters, Peter-Weyl theorem, universal enveloping algebra, Poincare-Birkoff-Witt theorem, Representations of Lie($SL(2, \mathbb{C})$). Abstract root systems, Weyl group, rank 2 root systems, Positive roots, simple roots, weight lattice, root lattice, Weyl chambers, simple reflections, Dynkin diagrams, classification of root systems, Classification of semisimple Lie algebras. Representations of Semisimple Lie algebras, weight decomposition, characters, highest weight representations, Verma modules, Classification of irreducible finite-dimensional representations, Weyl Character formula, The representation theory of SU(3), Frobenius Reciprocity theorem, Spherical Harmonics.

Course Title	:	Mathematical Foundations for Finance
Course Code	:	MA892
Credits	:	8 Credits
Course Category	:	Elective
Contact Hours	:	56 (including tutorials)

Learning about the mathematical modeling of simple stock markets and techniques to analyze them.

Course Contents:

Financial market models in finite discrete time, Absence of arbitrage and martingale measures, Valuation and hedging in complete markets, Basic facts about Brownian motion, Stochastic integration, Stochastic calculus: Itô's formula, Girsanov transformation, Itô's representation theorem, Black-Scholes formula

- 1. J. Jacod, P. Protter, "Probability Essentials", Universitext, Springer-Verlag, 2003.

Course Title	: Designs and Codes
Course Code	: MA893
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Understanding the technique used for constructing combinatorial designs and its relation with linear codes.

Course Contents:

Incidence structures, affine planes, translation plane, projective planes, conics and ovals, blocking sets. Introduction to Balanced Incomplete Block Designs (BIBD), Symmetric BIBDs, Difference sets, Hadamard matrices and designs, Resolvable BIBDs, Latin squares. Basic concepts of Linear Codes, Hamming codes, Golay codes, Reed-Muller codes, Bounds on the size of codes, Cyclic codes, BCH codes, Reed-Solomon codes.

- 3. W. Cary Huffman, V. Pless, "Fundamentals of Error-correcting Codes", Cambridge University Press, Cambridge, 2003.

Course Title	: Ordered Linear Spaces
Course Code	: MA894
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

Understanding the vector order structure and its relation with Functional Analysis.

Course Contents:

Cones and orderings; order convexity; order units; approximate order units; bases. Positive linear mappings and functionals; extension and separation theorems; decomposition of linear functionals into positive linear functionals. Vector lattices; basic theory. Norms and orderings; duality of ordered spaces; (approximate) order unit spaces; base normed spaces. Normed and Banach lattices; AM-spaces, AL-spaces; Kakutani theorems for AM-spaces and AL-spaces. Matrix ordered spaces: matricially normed spaces; matricial ordered normed spaces; matrix order unit spaces; Arveson-Hahn-Banach extension theorem.

Recommended books:

Course Title	: Topics in H^p Spaces
Course Code	: MA895
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

- Understanding analytic and harmonic functions on the unit disc.
- Understanding properties H^p spaces, for $1 \le p < \infty$.
- Understanding invarint subspaces for the shift operator on H^2 space.

Course Contents:

Fourier Series: Cesaro Means, Characterization of Types of Fourier Series; Analytic and Harmonic Functions in the Unit Disc: The Cauchy and Poisson Kernels, Boundary Values, Fatou's Theorem, H^p Spaces; The Space H^1 : The Helson-Lowdenslager Approach, Szego's Theorem, Completion of the Discussion of H^1 ; Factorization for H^p functions: Inner and Outer Functions, Blaschke Products and Singular Functions, The Factorization Theorem, Absolute Convergence of Taylor Series, Functions of Bounded Characteristic; Analytic Functions with Continuous Boundary Values: Conjugate Harmonic Functions, Theorems of Fatou and Rudin; The Shift Operator: The Shift Operator on H^2 , Invariant Subspaces for H^2 of the Half-plane, Isometries, The Shift Operator on L^2 .

Course Title	: Introduction to Dilation Theory
Course Code	: MA896
Credits	: 8 Credits
Course Category	: Elective
Contact Hours	: 56(including tutorials)

- Understanding contractive operators by exhibiting as a compression of unitary operators.
- Understanding Hardy classes and H^{∞} space.
- Understanding dilations of commuting and non-commuting contractions.

Course Contents:

Contractions and Their Dilations: Unilateral shifts, Wold decomposition, Bilateral shifts, Contractions, Canonical decomposition, Isometric and unitary dilations, Matrix construction of the unitary dilation, a discussion on rational dilation; Geometrical and Spectral Properties of Dilations: Structure of the minimal unitary dilations, Isometric dilations, Dilation of commutants; Functional Calculus: Hardy classes, Inner and outer functions, The classes H^{∞} and H_T^{∞} , The role of outer functions, Contractions of class C_0 ; Operator-Valued Analytic Functions: The spaces $L^2(\mathcal{U})$ and $H^2(\mathcal{U})$, Inner and outer functions, Lemmas on Fourier representation, Factorizations, Analytic kernels; Functional Models: Characteristic functions, Functional models for a given contraction, Functional models for analytic functions; A discussion on Commuting and non-commuting contractions and their dilations.
